Sample QA report: Toolshop (practice site, "with bugs" build)

- **Tester:** Osama Azab · **Date:** 2026-10-07 · **Type:** sample QA pass for portfolio purposes, not client work
- **Site under test:** https://with-bugs.practicesoftwaretesting.com (Toolshop v5.0, a shop built specifically for testers to practise on)
- **Expected behaviour taken from:** the reference build https://practicesoftwaretesting.com (same app without planted bugs)
- **Regression suite:** Playwright + TypeScript in this repo. Every bug below has its own re-runnable test (see README → "known bugs").

1. Scope

In scope	Out of scope
Home, category pages, product page, search, sort, cart action, main navigation, contact, login, register	Checkout and payment, account area, rentals detail, admin
Responsive layout 360–1440 px, broken images, long content, unusual characters (Arabic, emoji)	Load, security and penetration testing
Metadata audit (title, description, canonical, OG, lang, h1) and automated WCAG 2.2 A/AA scan (axe-core)	Manual screen-reader pass (noted as a follow-up)

Coverage logic: the money and lead paths (navigation → product → add to cart; contact form) got a full pass on all 6 projects. Metadata, link crawl, accessibility scan and breakpoint sweep ran once (desktop Chrome) because they don't depend on the engine.

2. Device and browser matrix

Project	Engine / version	OS	Viewport	Real or emulated
Desktop Chrome	Chromium 153.0.8010.12 (Playwright 1.63.0)	macOS 27.0.1	1280×720	real browser engine
Desktop Safari	WebKit 26.6 (Playwright build)	macOS 27.0.1	1280×720	**emulated** (not Apple Safari)
Desktop Firefox	Firefox 155.0	macOS 27.0.1	1280×720	real browser engine
iPhone 14	WebKit 26.6	iOS profile	390×664	**emulated**
Pixel 7	Chromium 153	Android profile	412×839	**emulated**
iPad (gen 7)	WebKit 26.6	iPadOS profile	810×1080	**emulated**

Evidence screenshots were taken at 1440×900 (desktop Chrome) unless stated. Most bugs reproduced in **every** project. Three are environment-specific: **BUG-13** (Chromium only), **BUG-14** (Firefox only) and **BUG-16** (phone widths below 768 px, also confirmed in a resized desktop Chrome window).

Final run (2026-10-07): 228 test executions across the 6 projects in 14.3 minutes. 96 checks passed, 94 known-bug checks failed exactly as recorded, 38 were skipped (desktop-only suites on other projects, and sort on phones, which BUG-16 blocks), and there were **0 unexpected results**.

3. Summary

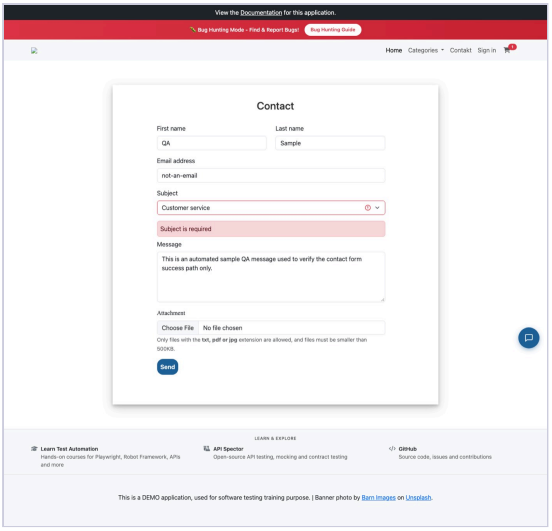

ID	Title	Severity	Where
BUG-07	Contact form can never be sent: "Subject is required" stays after choosing a subject	**Critical**	all projects
BUG-16	Below 768 px the "Filters" toggle does nothing, so search, sort and filters are unreachable on phones	**High**	iPhone 14, Pixel 7, and desktop Chrome resized to 390 px
BUG-05	"Add to cart" shows "Oeps, something went wrong." although the item is added (quantity ignored)	**High**	all projects
BUG-01	Main nav "Home" opens the Contact page	**High**	all projects
BUG-02	Categories menu: "UNDEFINED" opens an empty category; "Chainsaws" opens a 404 page	**High**	all projects
BUG-03	Sort labels are inverted (Price "Low - High" sorts high→low; Name "A - Z" sorts Z→A)	Medium	all projects with the sort control visible
BUG-06	Contact form accepts an invalid email ("not-an-email")	Medium	all projects
BUG-13	"Add to favourites" covers 50 px of the "Add to cart" button	Medium	**Chromium only** (desktop Chrome, Pixel 7)
BUG-09	Site logo and search icon are broken images (broken.png → 404)	Medium	all projects
BUG-14	Long product names are clipped mid-word in the product grid	Low	**Firefox only**

Also observed (each has a test, lower priority): BUG-04 quantity "+" button does nothing · BUG-08 contact subject list contains "Error 101: Subject not found" / "Error 202: Translation error" · BUG-10 product page heading "Reltded products" (and it is a second h1) · BUG-11 empty login submit shows "Invalid email or password" instead of field-level "required" messages · BUG-12 copy typos "Contakt", "Sorth", "Serch" · BUG-15 product names in the grid mix left and right alignment.

4. Bugs

BUG-07: Contact form can never be sent, "Subject is required" persists after a subject is chosen

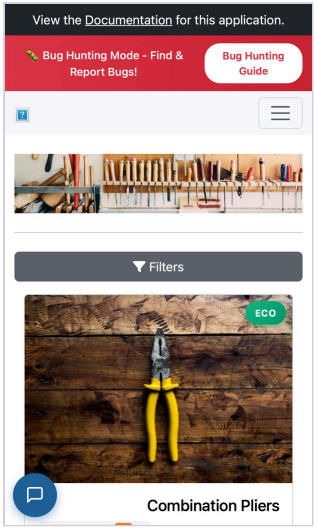

- **Severity:** Critical. The site's only contact/lead form is unusable for every visitor.
- **Environment:** all 6 projects. Evidence: desktop Chrome 153, macOS 27.0.1, 1440×900.
- **Steps:**
  1. Open `/#/contact`.
  2. Enter First name `QA`, Last name `Sample`, Email `qa.sample@example.com`.
  3. Choose Subject **Customer service** (also tried Webmaster and Payments).
  4. Enter a message of 50+ characters and click **Send**.
- **Expected:** the message is sent and a confirmation is shown (reference build: "Thanks for your message! We will contact you shortly.").
- **Actual:** the subject field turns red with "Subject is required" even though its value is `customer-service`. Nothing is sent, and there is no confirmation.
- **Evidence:** `evidence/BUG-06-07-contact-form.png`

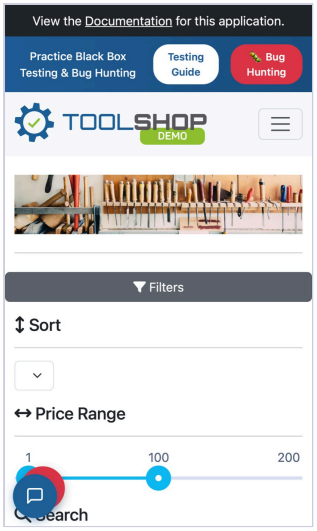

- **Fix hint:** the validator likely reads a different control or value than the one bound to the select (check the form-control name or the `required` validator on `subject`).

BUG-16: Below 768 px the "Filters" toggle does nothing, so search, sort and filters can't be reached on phones

- **Severity:** High. On phones, where most marketing traffic lands, visitors can't search, sort or filter the catalogue at all.
- **Environment:** iPhone 14 (WebKit, **emulated**) and Pixel 7 (Chromium, **emulated**). **Also reproduced in plain desktop Chrome 153 resized to 390×844**, so it's a breakpoint bug, not an emulation artefact. Not applicable at ≥ 768 px (desktop and iPad show the sidebar).
- **Steps:** open the home page at a phone width → tap **Filters** above the product grid.
- **Expected:** the panel expands with Sort, Price Range, Search and the category/brand filters (it does on the reference build).
- **Actual:** nothing happens. The panel stays collapsed, and the search box and sort select stay hidden.
- **Evidence:**
  - `evidence/BUG-16-filters-tapped-iphone14-emulated-bug.png`

    

    (iPhone 14, emulated)
  - `evidence/BUG-16-filters-tapped-iphone14-emulated-ref.png`

(reference build)

- `evidence/BUG-16-filters-tapped-pixel7-emulated-bug.png`

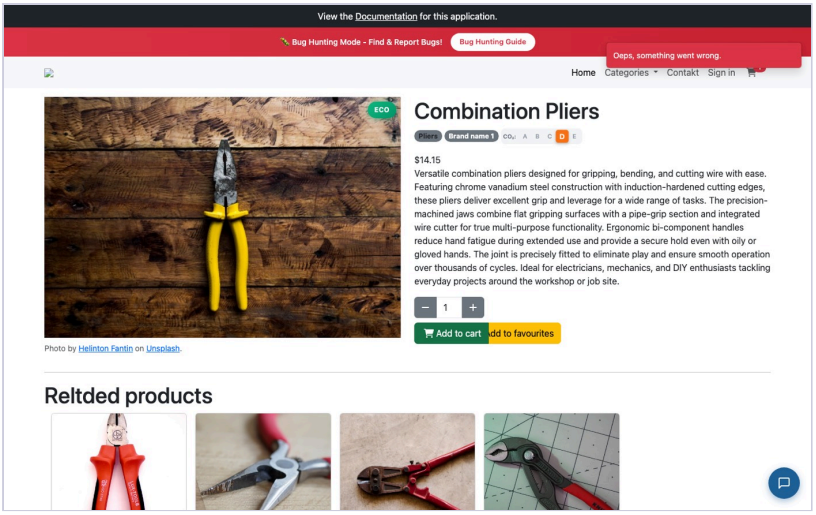

(Pixel 7, emulated)

- **Fix hint:** the buggy build renders the toggle as an `<a>` with `aria-controls="collapseExample"`, while the reference build uses a `<button data-bs-target="#filters">`. Check that the collapse handler is bound to the `#filters` panel, and that the anchor's default hash navigation doesn't swallow the click in the hash-routed app.

BUG-05: "Add to cart" shows an error message although the item is added

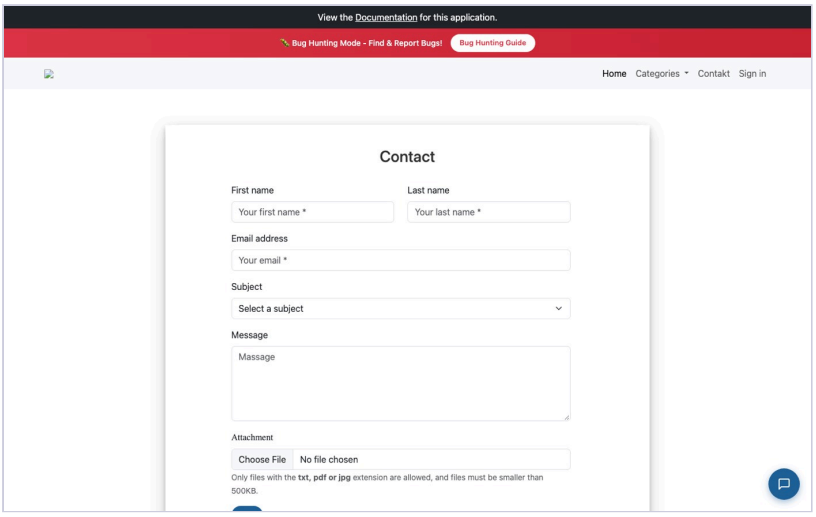

- **Severity:** High. A core commerce action reports failure, so users will retry (and add duplicates) or leave.
- **Environment:** all 6 projects. Evidence: desktop Chrome, 1440×900.
- **Steps:** open any product (e.g. `/#/product/1`, Combination Pliers) → click **Add to cart**.
- **Expected:** green toast "Product added to shopping cart." and the cart badge shows the chosen quantity (reference build).
- **Actual:** red toast **"Oeps, something went wrong."** The cart badge still increments to 1, so the item *was* added. The message is wrong. The quantity can't be raised anyway: the "+" button does nothing (BUG-04).
- **Evidence:** `evidence/BUG-05-add-to-cart-error-toast.png`

- **Fix hint:** check the success branch of the add-to-cart call; it appears to fire the error toast on a 2xx response.

BUG-01: Main navigation "Home" opens the Contact page

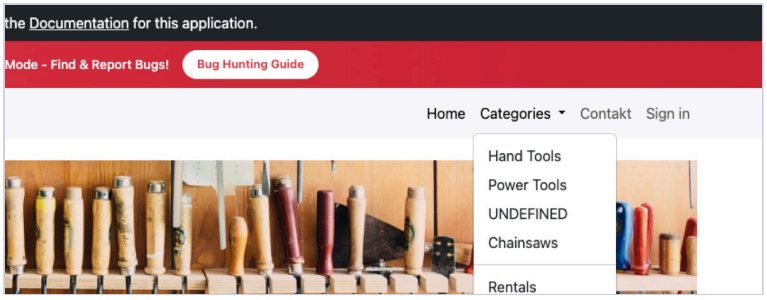

- **Severity:** High. Primary navigation on every page sends users to the wrong place.
- **Environment:** all 6 projects (link target is the same on mobile menus).
- **Steps:** open any page (e.g. a product page) → click **Home** in the top navigation.
- **Expected:** the home/catalogue page (`/`).
- **Actual:** the URL becomes `/#/contact` and the Contact form opens. The link's `href` is `#/contact`.
- **Evidence:** `evidence/BUG-01-home-link-opens-contact.png`

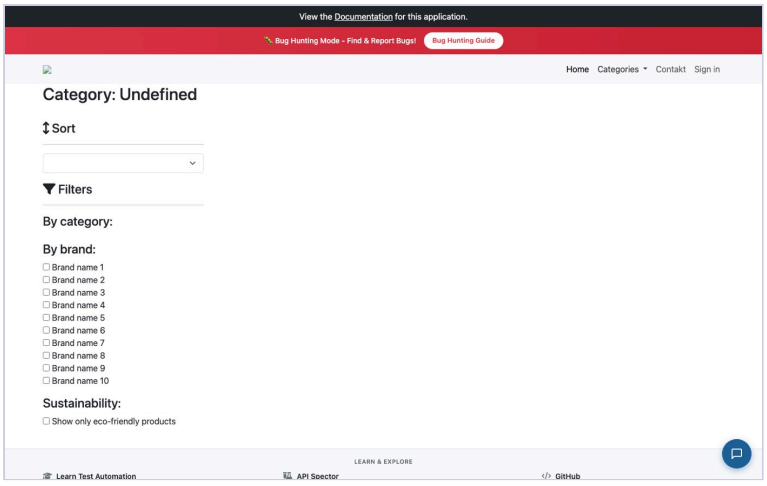

- **Fix hint:** `routerLink` of `nav-home` points to `/contact`.

BUG-02: Categories menu, "UNDEFINED" opens an empty category and "Chainsaws" opens a 404 page

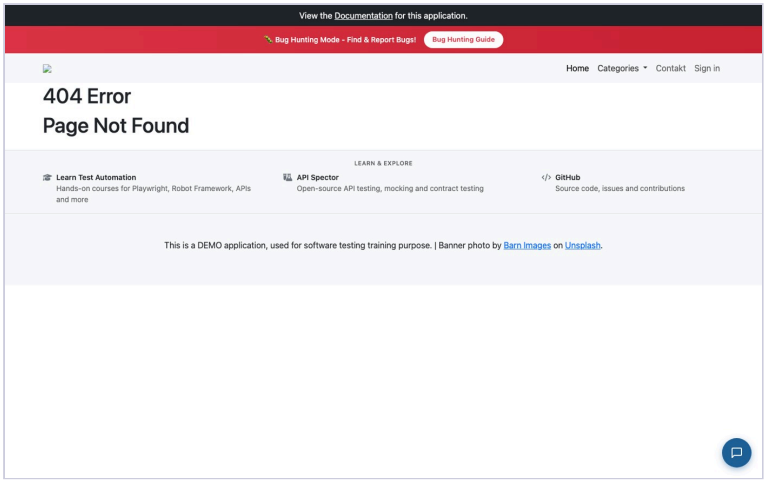

- **Severity:** High. Two of the four category entries are dead ends, and the menu shows a raw "UNDEFINED" label.
- **Environment:** all 6 projects. The link crawl (34 internal routes) found exactly these two broken routes.
- **Steps:** click **Categories** → **UNDEFINED**; then **Categories** → **Chainsaws**.
- **Expected:** real categories with products (the reference build shows "Other" and "Special Tools" in these positions).
- **Actual:** "UNDEFINED" → `/#/category/undefined`, page title "Category: Undefined", 0 products. "Chainsaws" → `/#/chainsaws`, "404 Error – Page Not Found".
- **Evidence:**
  - `evidence/BUG-02-categories-menu.png`

- `evidence/BUG-02-category-undefined.png`

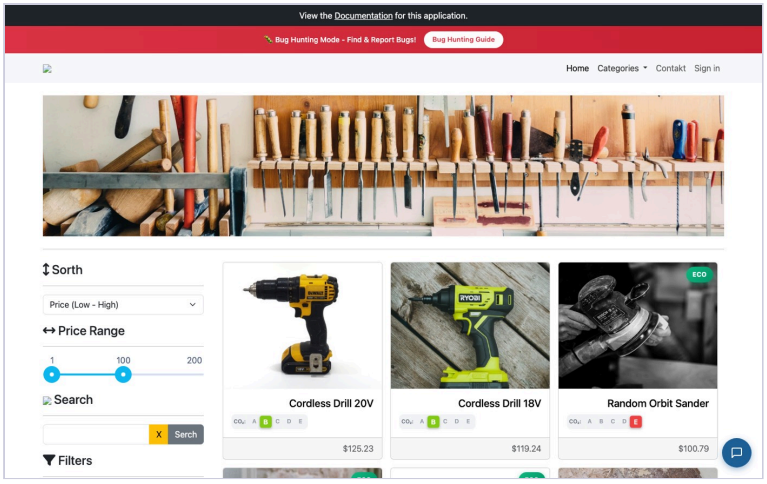

- `evidence/BUG-02-chainsaws-404.png`

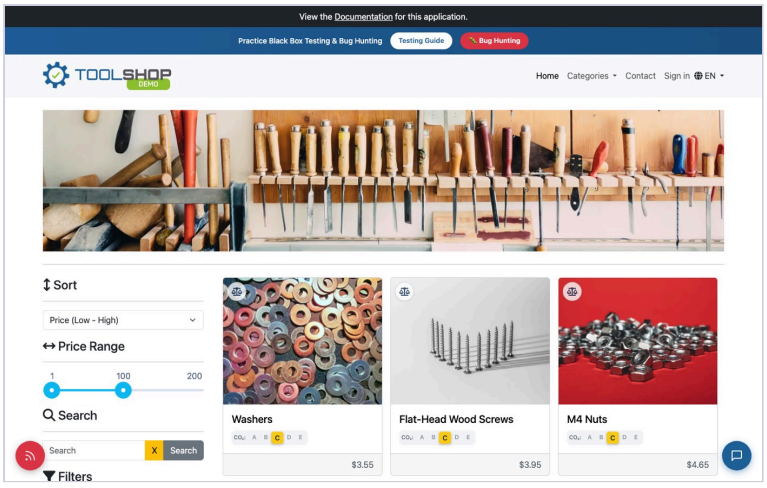

- **Fix hint:** the menu item's slug/label come from an undefined property, and the special-tools link is missing the `/category/` prefix.

BUG-03: Sort labels are inverted

- **Severity:** Medium. Sorting works, but the opposite of what it says, which makes it look broken to shoppers.
- **Environment:** desktop Chrome, Safari (WebKit), Firefox and iPad. On phones the sort control can't be reached at all (BUG-16).
- **Steps:** on the home page choose Sort **Price (Low - High)**; then **Name (A - Z)**.
- **Expected:** prices ascending ($3.55, $3.95 … on the reference build); names A→Z.
- **Actual:** "Price (Low - High)" shows $125.23, $119.24, $100.79 …; "Name (A - Z)" shows Wood Saw, Thor Hammer, Slip Joint Pliers … The option values are swapped (`price,asc` is labelled "High - Low").
- **Evidence:**
  - `evidence/BUG-03-sort-low-high-shows-high-first.png`

- `evidence/REF-sort-low-high.png`

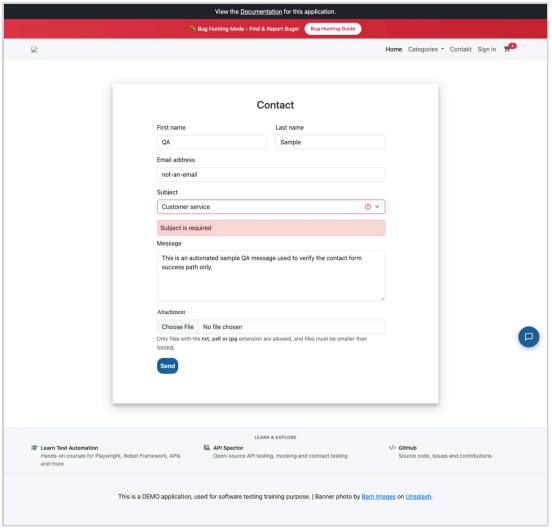

(reference build)

- **Fix hint:** swap the labels or values of the four sort options.

BUG-06: Contact form accepts an invalid email address

- **Severity:** Medium. It would let unusable leads through. It's currently hidden behind BUG-07, so it will surface as soon as BUG-07 is fixed.
- **Environment:** all 6 projects.
- **Steps:** `/#/contact` → Email `not-an-email` → fill the other fields → **Send**.
- **Expected:** "Email format is invalid" (reference build).
- **Actual:** no email error is shown; only the (wrong) subject error from BUG-07.
- **Evidence:** `evidence/BUG-06-07-contact-form.png`

- **Fix hint:** add the email pattern/validator back to the `email` control.

BUG-13: "Add to favourites" covers 50 px of the "Add to cart" button (Chromium only)

- **Severity:** Medium. The primary CTA label is cut ("Add to") in the most-used browser engine.
- **Environment: reproduces in desktop Chrome 153 and Pixel 7 emulation (Chromium).** Not reproduced in desktop Safari/WebKit, iPhone 14, iPad or Firefox, where the buttons join with the normal 1 px border. Pixel 7 is emulated: **needs confirmation on a real Android device.**
- **Steps:** open `/#/product/1` and look at the two buttons under the quantity field.
- **Expected:** the buttons sit side by side with the full "Add to cart" label visible.
- **Actual:** in Chromium the favourites button has `margin-left: -50px` and covers the right part of "Add to cart". In WebKit/Firefox the computed `margin-left` is `-1px`.
- **Evidence:**
  - `evidence/BUG-13-buttons-chrome-desktop.png`

    (desktop Chrome)
  - `evidence/BUG-13-buttons-pixel7-emulated.png`

    (Pixel 7, emulated)
  - `evidence/BUG-13-buttons-safari-desktop-webkit.png`

    (Safari/WebKit, no overlap)
- **Fix hint:** look for a Chromium-targeted CSS rule or a browser check that sets the negative margin.

BUG-09: Site logo and search icon are broken images

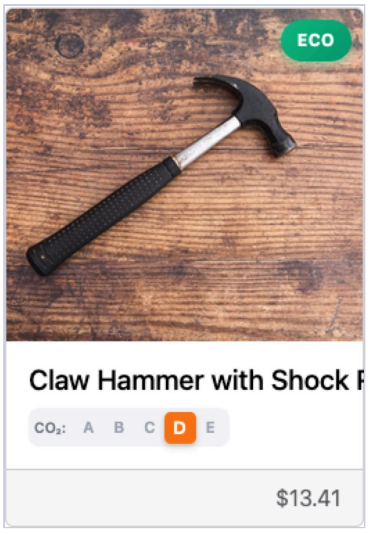

- **Severity:** Medium. The brand logo is missing on every page, and two 404 requests and console errors fire on each load.
- **Environment:** all 6 projects.
- **Steps:** open the home page with DevTools → Network.
- **Expected:** the logo and search icon render.
- **Actual:** both `<img>` point to `broken.png` → **HTTP 404**, so the browser shows the broken-image icon (top-left logo and next to "Search"). The images also have no `alt` text (see the axe results).
- **Evidence:** `evidence/BUG-09-broken-images-home.png`

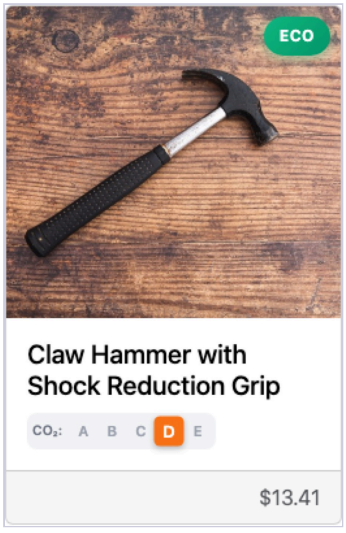

- **Fix hint:** restore the asset paths and add `alt` (or `alt=""` for the decorative icon).

BUG-14: Long product names are clipped mid-word in the product grid (Firefox only)

- **Severity:** Low. The product name is cut ("Claw Hammer with Shock R") with no ellipsis or tooltip, so shoppers can't read it on the listing.
- **Environment: Firefox 155 desktop only.** Chromium and WebKit wrap the name onto two lines; the reference build is fine in Firefox.
- **Steps:** open the home page in Firefox and find "Claw Hammer with Shock Reduction Grip".
- **Expected:** the full name is visible, wrapped onto two lines as in Chrome.
- **Actual:** the name is on one line (`white-space: nowrap`), 370 px of text in a 225 px box, clipped without an ellipsis.
- **Evidence:**
  - `evidence/BUG-14-long-name-firefox.png`

    (Firefox)
  - `evidence/BUG-14-long-name-chrome.png`

    (Chrome, wraps correctly)
- **Fix hint:** a Firefox-targeted rule sets `white-space: nowrap` ; remove it, or add `text-overflow: ellipsis` with a `title` attribute.

5. Automated audit highlights (report-only suites)

- **Metadata (4 key pages):** all pages miss a meta description and canonical URL, none has an `<h1>` , and every page shares one `<title>` ("Practice Software Testing - Toolshop - v5.0 with bugs"). Full list: `audit/seo-findings.json` .
- **Accessibility, axe WCAG 2.2 A/AA (4 pages):** `image-alt` (critical, 10–11 product images per listing page), `select-name` (unlabelled sort select), `label` (unlabelled field on home), `button-name` (icon-only button on login), `color-contrast` (serious, 2–3 elements per page), `list` (invalid list markup). Full list: `audit/a11y-findings.json` . The automated scan covers only part of WCAG; a keyboard and screen-reader pass is still needed.

- **Responsive sweep (360–1440 px, home/contact/login):** no horizontal overflow, and key elements visible at every breakpoint. Screenshots in the HTML report.
- **Links:** 34 internal routes crawled (`audit/links-findings.json`), and only the 2 in BUG-02 are broken. 11 external Unsplash credit links return 401 to automated requests (bot protection), so they were marked "unverified", not broken.

6. How AI was used, and where it misled me

Used for: drafting the test permutations (form inputs incl. Arabic/emoji/long text, breakpoint list, device matrix), writing the first version of each spec, parsing console and network output, and comparing the buggy build against the reference build.

Where it misled me (caught on manual re-check):

1. **False positive: search.** The first automated search test reported "Bolt Cutters" in results for "pliers". Re-running by hand showed the result list was correct; the test read the grid before it re-rendered. Fixed with a poll on the result list. Not filed.
2. **False positive: link crawl.** The first crawl marked all 32 pages as broken. Hash-route navigations return no HTTP response object (which the script treated as an error), and a loose "404" text match hit normal pages. I rewrote the detector to look for the actual 404 view and "undefined" titles, and it now finds exactly the two real broken routes.
3. **Wrong scope: button overlap.** It was first noted as a general layout bug from a Chrome screenshot. Running the matrix showed it is **Chromium-only**, which changes the fix and who is affected. Reported that way.
4. **Real bug at first dismissed as a test issue: mobile search.** On phones the search test timed out, and my first read was "test problem, the search box sits in a collapsed panel". Opening the panel by hand on the reference build worked; on the buggy build the toggle did nothing, and the same happened in a resized desktop Chrome window. That became BUG-16, the most important mobile finding.
5. **Not a bug: external links.** Unsplash links returning 401 looked broken to the script; they work in a browser (bot protection). Marked "unverified".

Every bug in section 4 was reproduced manually, step by step, and compared with the reference build before filing.
